I am a third-year B.S. student in Automation at Guangdong University of Technology, enrolled in the selective Outstanding Engineer Class. My research focuses on how time-series models capture and explain informative temporal patterns, spanning interpretable classification, representation learning from early and sparse clinical observations, and debiased anomaly detection. This work has resulted in three first-author papers accepted at KDD 2026, BIBM 2025, and PRICAI 2025, along with a first-author manuscript under review at AAAI 2027. I will present *AnchorMoE* at the KDD 2026 main conference in Jeju this August. Going forward, I seek doctoral or industrial research opportunities to collaborate on scalable and interpretable sequence models, bridging discriminative time-series learning with broader foundation models to support human understanding and reliable decision-making.

EDUCATION

Guangdong University of Technology, Guangzhou, China

Sep 2023 – Jun 2027 (expected)

School of Automation

- Bachelor of Science in Automation, Outstanding Engineer Class (top 5% admission)
- GPA: 88/100

RESEARCH EXPERIENCE

OMG Lab, GDUT — Undergraduate Researcher

Mar 2025 – Present

SIGMTA Group · Supervisor: Prof. [Yiqun Zhang](#) (GDUT); co-supervised by Prof. [Yiu-ming Cheung](#) (HKBU)

- **Interpretable time-series classification:** developed *AnchorMoE*, which discovers discriminative patterns in multivariate time series and uses them for anchor-routed classification, providing intrinsic interpretability without post-hoc explanation — first-author paper at KDD 2026.
- **Early time-series analysis for clinical applications:** developed *MEET-Sepsis* for early sepsis prediction from sparse clinical observations and *DE3S* to generalize early classification across diverse disease phenotypes — first-author papers at PRICAI 2025 and BIBM 2025.
- **Debiased time-series anomaly detection:** developed *STAGE* to mitigate a coupled biases from unequal patch abundance and changing window contexts through timestamp alignment, adaptive control of encoder updates, and data-dependent exemplar retention — first-author manuscript under review at AAAI 2027.
